Introduction

Cameron is a leading provider of valves, valve automation, and measurement systems to the oil and gas industry. Our products are primarily used to control, direct, and measure the flow of oil and gas as it is moved to refineries, petrochemical plants, and industrial centers for processing.

We provide valve products that are sold through distributor networks worldwide. Our products are used in oil and gas and industrial applications and include widely recognized brands such as DEMCO* valves; NAVCO* floating ball valves; NEWCO* gate, globe, and check valves; DOUGLAS CHERO* forged-steel gate, globe, and check valves; NUTRON* ball valves; TOM WHEATLEY* check valves; WHEATLEY* check valves; and WKM* valves.

Designed for dependable, heavy-duty performance in abrasive and corrosive service conditions, butterfly-style DEMCO valves are commonly selected for a number of oilfield applications, including drilling and production.

Features and Benefits

As one of the most durable resilient-seated butterfly valves in the industry, the Cameron butterfly-style DEMCO valve excels in a variety of applications.

Cast in both wafer and tapped lug patterns in a variety of material choices, butterfly-style DEMCO valves feature a one-piece body for reduced weight and increased strength.

The unique stem hole design in the disc ensures a dry stem journal. The hard-backed seat enables ease of installation, reliable operation, and infield repairability without special tools. Butterfly-style DEMCO valves are available in sizes 2 to 36 in [50 to 900 mm].

Engineered for long-term, reduced-maintenance performance, butterfly-style DEMCO valves are commonly selected for a variety of applications in the following industries:

- chemical and petrochemical
- agriculture
- oil and gas drilling and production
- food and beverage
- water and wastewater
- cooling towers (HVAC)
- power
- mining and materials
- dry bulk handling
- marine and government.

Bidirectional sealing

The butterfly-style DEMCO valve provides bidirectional sealing at full-rated pressure with identical flow from either direction.

Integral flange seal

An integral flange seal molded into the edge of the seat accommodates ASME weld neck, slip-on, threaded, socket, and stub-end type C flanges.

ASME Class 150 rating

With a body rating of American Society of Mechanical Engineers (ASME) Class 150 (285-psi nonshock), the wafer body diameters are designed to self-center in the ASME Class 150 flange pattern.

Wafer-style DEMCO valve.

Multiple pressure ratings

Three drop-tight pressure ratings are offered for 2- to 12-in [50- to 300-mm] sizes. The standard shutoff pressure rating is 200 psi, but 285- and 50-psi shutoff ratings are also available. A throttling 0-psi-rated valve is available where drop-tight closure is not required and minimal torque is desired. Both the 50-psi and throttling ratings allow for smaller actuators, which can significantly reduce overall installation cost in automated applications. The 14- to 36-in [350- to 900-mm] valves are available in 150- and 285-psi drop-tight shutoff ratings.

Dry stem journal that reduces potential for leakage

The DEMCO valve's disc is uniquely designed with a continuous annular-raised band around the stem hole and disc edge, which presses flat into the seat at every angular position.

The resilient seat presses back with a higher force than the line pressure, preventing leakage to the stem. In addition, two O-ring ribs are provided in the seat stem bore, creating a triple stem seal. In comparing stem seal designs with boot seats, a seal is accomplished by an interference squeezing on the stem or an O-ring in the stem journal. The potential for leakage behind the seat is high for this type of design. As the disc wipes the seat, elongation of the stem seal area enables leakage to collect behind the seat. This condition is reduced by the DEMCO valve's dry stem journal and hard-backed seat.

Hard-backed cartridge seat

The DEMCO valve's cartridge seat is constructed by permanently bonding a resilient elastomer to a rigid backing ring. In addition to superior sealing integrity, this design

- makes valve installation easier because no special precautions are required for disc position, which is especially advantageous when installing valves with fail-closed actuators
- reduces high torque and premature failure caused by elastomer distortion, as found in other nonrigid seat designs
- simplifies seat replacement because the seat is slip-fitted into the body with no need for special tools.

Dry stem journal.

Hard-backed cartridge seat.

Positively oriented disc

The rectangular drive ensures the proper orientation of the stem disc connection. In 2- to 24-in [50- to 600-mm] size valves, the disc is permitted to float on the stem to center in the valve seat. This design enhances drop-tight sealing and prolongs service life.

End-of-line service

Lug body valves may be used in end-of-line service with downstream piping removed. Only weld-neck or socket flanges can be used for this service. Since upstream pressure is excluded between the flange and the seat face by the DEMCO valve's flange seal design, there is no effective force to slide the seat downstream. The 2- to 12-in [50- to 300-mm] lug butterfly-style DEMCO valves are suitable for liquid service up to 200 psi with downstream piping removed at 150 psi for 14- to 36-in [350- to 900-mm] valves.

Lug body valves are recommended for isolation of pumps, control devices, or other system components, which may need to be removed for repair or replacement. Lug valves also are suitable for installation at points from which piping expansion may proceed. Such valves normally are blanked with blind flanges to protect the exposed seats until new piping is attached.

Design and testing specifications

- MSS SP-67 (testing is applicable upon request)
- MSS SP-25 (standard marking system for valves)

In addition, butterfly-style DEMCO valves can be supplied to comply with these standards:

- ABS
- EAC
- CE/PED
- API Spec 607 4th Ed. fire test
- CRN
- US Coast Guard 46 CFR 56.20.
- DNV

Styles and Accessories

Butterfly-style DEMCO valves come in a variety of styles to suit a range of applications. In addition, a variety of quality accessories are available to further enhance its suitability to the application.

Series NE-C

Sizes 2 to 12 in [50 to 300 mm] are available in both wafer and lug styles. This series is a general-purpose valve with a neck length designed to provide full clearance for the valve top over 2 in of insulation on ASME Class 150 pipe flanges.

Series NE-I

Sizes 2 to 12 in [50 to 300 mm] are suited for a range of applications in many industries, including food and beverage, utilities, and process flowlines. This short neck design is offered in a variety of body materials. The valves are designed for installation between ASME Class 125 and 150 flanges.

Series NE-D

The valves in this series can be made in sizes 2 to 12 in [50 to 300 mm]. The Series NE-D valve is a short-neck valve with body notches to fit popular, lightweight flange patterns, making it ideal for both the bulk material handling and the transportation industries. Valves also will center in ASME Class 125 and 150 flanges.

The valves are designed for installation between ASME Class 125 and 150 flanges. The Series NE-D valve is also available with the short-pattern version (**NE-D SP**).

Series NF-C

Sizes 14 to 36 in [350 to 900 mm] are available in both wafer and lug styles. The wafer body has two drilled locator lugs at the top and bottom for ASME Class 150 flanges. Bronze bearings are installed on both stems for reduced operating torque.

*Series NF-C lug 16 in [400 mm].
Also available in wafer style (not shown).*

Series NE-C lug 6 in [150 mm].

Series NE-C wafer 6 in [150 mm].

Series NE-I lug 8 in [200 mm].

Series NE-I wafer 3 in [80 mm].

Series NE-D wafer 4 in [100 mm].

Marine

Butterfly-style DEMCO valves for marine applications are available in the NE-C lug, NE-I lug and wafer, NE-D wafer, and NF-C lug styles and conform to

- Title 46 of the Code of Federal Regulations
- Part 56 of the US Coast Guard's Marine Engineering Regulations
- US Coast Guard Category (A) Acceptance on API Spec 607 qualified valves
- American Bureau of Shipping Standard, including tagging per MSS SP-25 and testing per MSS SP-67.

Actuators

Consult Cameron or visit cameron.slb.com/valves for actuation options.

Handles and stem extensions

There are three basic handle designs that are compatible with any 2- to 12-in [50- to 300-mm] valve: ten-position locking, two-position locking, and memory stop. Memory-stop handles provide throttling, which is infinitely adjustable and can be set by a lock nut with a memory-stop setting (adjustable open stop). Handles are available in basic trim, corrosion-resistant trim, and sanitary trim. Please consult Cameron for information on stem extension.

Gear operators

DEMCO valve weatherproof gear operators are offered with a choice of handwheel. The worm gear has either self-locking set screws to control open and closed positioning or an optional adjustable memory-stop for balance return to a preset open position after closing.

DEMCO valve with actuator.

DYNATORQUE® valve accessories gear box.

Marine Series

Butterfly-style DEMCO valves for marine applications meet all the requirements of US Coast Guard's Marine Engineering Regulations as outlined in Title 46 of the Code of Federal Regulations, Part 56 and the American Bureau of Shipping Standard, including tagging per MSS SP-25 and testing per MSS SP-67. All valves are shell tested at 1½ times rated working pressure and seat tested at rated working pressure.

Worm Gear Operators

Manual worm gear operators are self locking in all positions. Adjustment screws stop travel at open and closed positions. Position indicator is standard on all models. Gearing is permanently lubricated.

Gray iron weatherproof case and cover enclose a ductile iron gear and hardened steel worm supported by bronze bearings. Standard external coating is green enamel. White epoxy, coal tar epoxy, and inorganic zinc primer are available upon special request.

¹DT-1 gear operator dimensions became standard gear operator mid-year 2000 (for old style DT-3, consult Cameron).

General Technical Information

Pressure rating

Three drop-tight pressure ratings are offered for butterfly-style DEMCO valves. Normally, 200-psi shutoff is used in butterfly applications. However, 285-psi shutoff is optionally available for higher pressure applications. For smaller actuator sizing, 50-psi valves offer reduced torque.

For reduced torque, throttling valves—which do not provide drop-tight closure—are available.

Vacuum rating

Butterfly-style DEMCO valves will seal against 10 um of vacuum (29.9 in-Hg). For reduced torque and extended seat life, 50-psi discs are recommended for the dry service conditions found in many vacuum applications.

End-of-line service

Lug body valves can be used in end-of-line service, with downstream piping removed. Only weld neck or socket flanges can be used for this service. Since upstream pressure is excluded between the flange and the seat face by the exclusive DEMCO valve flange seal, there is no effective force to slide the seat downstream. Lug butterfly-style DEMCO valves are recommended for liquid service up to 200 psi with downstream piping removed.

Lug body valves are recommended for the isolation of pumps, control devices, or other system components that may need to be removed for repair or replacement.

Lug valves also are suitable for installation at points from which piping expansions may proceed. Such valves normally are blanked with blind flanges to protect the exposed seats until new piping is attached.

Marking

Each valve is positively identified by marking and tagging per MSS SP-25.

Actuation

Positive latch handles, worm gear operators, and automatic actuators are available and interchangeable on the DEMCO valve.

The DEMCO valve's top flange is dimensionally compatible with other butterfly valves. With the optional "utility top" stem, the DEMCO valve interchanges directly with other valves, enabling valve replacement without the need for new actuation.

Installation and maintenance

Butterfly-style DEMCO valves are bidirectional, with identical flow way from either face. To install, simply close the valve, insert between flanges, and make up with studs or cap screws. No regular maintenance or lubrication is required. Disassembly for inspection or replacement of parts is simple.

Open the valve, remove handle or actuator, remove tangential pins, pull out the stems, and push the disc and seat out of the body. Reassemble in reverse order, with a small amount of general-purpose nonhydrocarbon-based lubricant on the outside of stems, seat, and disc flats.

Steel or cast iron flanges of either raised- or flat-faced type are suitable for use with butterfly-style DEMCO valves. Plastic flanges are subject to damage at installation by overtightening the bolting and may deflect or cup, resulting in flange leaks. Refer proposed plastic flange installations to Cameron for review and recommendation.

Throttling discs with no seat interference do not provide a stem seal. Stem O-rings are provided for this application. Flange gaskets assist the O-rings in 2- to 12-in [50- to 300-mm] valves and must be used only with throttling discs.

Wafer valve connection.

Lug valve connection with downstream flange removed.

Torque Data

The torque required to operate a given butterfly valve is determined by two factors: friction of the disc and the seat. The interference and dynamic forces of flow through the valve tend to open or close the valve. The actuator torque output must meet or exceed the maximum torque requirement of the valve. Dry service will increase opening torque significantly. Consult Cameron for dry service torque requirements.

The disc of a butterfly valve, in partially opened condition, is subject to lift forces from passage of fluid over its surfaces.

This effect is analogous to an airplane wing and results in an unbalanced turning force on the disc. The dynamic torque is proportional to the pressure drop through the valve and may become significant in some applications.

Dynamic torque typically is at a maximum when the disk opening is about 70°. Under high differential pressure conditions, such torque may exceed the design strength of stems, connections, or actuators.

Butterfly Valve Torques (Except Series NEI-T)[†]—Normal Wet Opening, in.lbf

[†]Conforms to USCG Marine requirements, as outlined in 46 CFR, part 56. Consult Cameron for special material requirements.

Seats vary. See pages 10, 11, and 12 for seat material description and part number scheme for available options for different valve series.

Buna-N is a general-purpose elastomer compounded for maximum hydrocarbon or petroleum resistance. Temperature rating is 0 to 180 degF [–18 to 82 degC], the same as nitrile, Hycar[®] and NBR.

General service EPDM is recommended for water service. Resistance to saturated steam up to 275 degF [135 degC] is superior. EPDM is suitable in alkaline solutions. EPDM is not suitable for oil or hydrocarbons. Peroxide-cured version is rated to 20 to 275 degF [–6 to 135 degC].

FKM is superior at elevated temperatures and in harsh chemical environments. FKM is not suitable for hot water or steam. Temperature rating is 20 to 300 degF [–6 to 149 degC], the same as fluoroelastomer.

Natural rubber generally is superior to other elastomers in abrasion resistance and is recommended for dry material handling. Use in oils and solvents is not recommended. Temperature rating is from –30 to 150 degF [–34 to 65 degC].

Other seat elastomers are available for special applications. Consult Cameron.

Fire Test

DEMCO butterfly valves with the resilient seat design have been fire tested and qualified to meet the stringent requirements of API Spec 607 4th Edition. This valve design provides fire-test capabilities regardless of flow direction.

Sizes Qualified	2 to 6 in	8 to 36 in
Body style	Lug	Wafer and lug
Body material	Ductile iron	Ductile iron
Seat material	FKM	FKM
Working pressure	285 psi	200 and 285 psi

ZPEX coating system

The ZPEX coating is designed specifically for severe service environments. ZPEX system is ideal for oil and gas, salt water, water treatment, chemical processing, and other extreme applications. Unlike single-component coatings, the ZPEX system has been designed as a system of interdependent thin-film coatings working in concert to provide the ultimate protection for extreme environments.

The ZPEX system begins with an electrodeposited epoxy primer (e-coat), wherein the part is immersed in a series of tanks consisting of cleaning, pretreatment, and epoxy coating. This primer process creates a chemical-resistant base coat that forms an electromolecular bond with the substrate as well as provides corrosion protection to 100% of the part, even in hard-to-reach recesses and threads.

To complete the ZPEX system, a fluoropolymer topcoat is applied over the e-coat primer. The superior bond created in our patented crosslinking of the epoxy and fluoropolymer coatings prevents the ZPEX system from chipping or peeling and prevents corrosion from creeping under the coating if ever compromised.

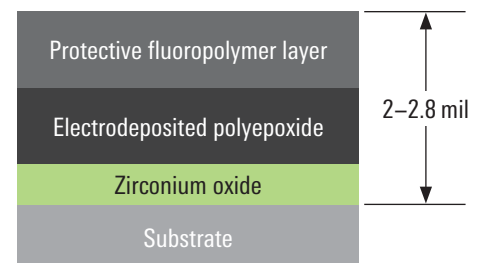

The system can replace stainless steel in most corrosive environments, including salt water and hydrogen sulfide. The ZPEX system has also outlasted stainless steel 7× over at a fraction of the cost. The lead time is approximately 1 week.

ZPEX system advantages

- Lower energy consumption while increasing flow rates in pump applications
- Prevention of thread galling
- Reduced downtime
- High abrasion resistance
- Thin film for application on ring grooves, Victaulic® connections, threaded connections, machined surfaces, and recessed areas
- <4,000-h ASTM B117 salt spray
- Excellent performance in HPHT autoclave testing
- 500-degF [260-degC] maximum operating temperature
- 2.0- to 2.8-mil dry film thickness
- Low coefficient of friction (.016)

Fire test per API Spec 607 4th Edition.
