# WKM 370D6 Trunnion- Mounted Ball Valves

Cameron is a leading provider of valve, valve automation, and measurement systems to the oil and gas industry.

Our products control, direct, and measure the flow of oil and gas as it is moved to refineries, petrochemical plants, and industrial centers for processing. We provide valve products that are sold through distributor networks worldwide. Our products are used in oil, gas, and industrial applications and include widely recognized brands such as

- DEMCO\* valves
- NAVCO\* floating ball valves
- NEWCO\* gate, globe, and choke valves
- DOUGLAS CHERO\* forged-steel gate, globe, and check valves
- NUTRON\* ball valves
- THORNHILL CRAVER\* choke valves
- TOM WHEATLEY\* check valves
- WHEATLEY\* check valves
- WKM\* valves.

Our WKM valve product line offers gate valves, trunnion-mounted and floating ball valves, and butterfly valves, all built to standards for demanding applications. The WKM 370D6\* trunnion-mounted ball valve is recognized throughout the world for durability, reliability, and flexibility in many challenging situations.

# ASME Classes 150–2500 and 5,000-psi valves

2 to 16 in [50 to 400 mm]

WKM 370D6 ball valves are designed and engineered for heavy-duty performance. Used in many general-purpose petroleum and chemical process applications, these valves also can be specified for more demanding applications.

## Features and benefits

### Fire tested for safety

WKM 370D6 ball valves are qualified under API Spec 607 standards.

### Actuation friendly

Valves can come with a gear operator from DYNATORQUE\* valve accessories or an ISO:5211 certified mounting pad for easy actuation.

### End connections

Valves are generally flanged; 2-, 3-, and 4-in Class 150 valves come in flanged × flanged configuration.

### Body style

Two-piece body is standard.

### Standard materials

Choose carbon steel, stainless steel (SS), and low-temperature carbon steel.

### Optional stem materials

Choose 316 SS, 410 SS, 4130 LAS, and INCONEL® material.

### Double-block-and-bleed operation

The pressure-actuated seats and bleed fittings enable double-block-and-bleed operation. When used for block and bleed, this feature can permit the valve to take the place of two valves. It also enables the operator to check up- and downstream sealing by bleeding off the body pressure. All sizes can block and bleed in both the open and closed position.

### Standard NACE trim†

Valves are compliant with NACE MR0175 and ISO:15156 certification for buried service.

### Bidirectional flow

This valve uses pressure-actuated seats with locked-in, nonmetallic face seals. To help ensure sealing at low pressure, special wave springs force the seats against the ball. At higher pressures, the upstream seat is forced against the ball by the pressure working across the differential area between the seat insert and the seat O-ring. The higher the pressure, the tighter the seal.

Can be used for  
bidirectional flow.

### Secondary seat seal injection

In the event of damage to the valve seat, sealant can be injected to temporarily seal the valve.

### Automatic body pressure relief

Seats internally relieve excess body pressure.

† NACE MR0175 and ISO:15156 compliance—Materials of construction shall be in compliance with the prequalified material requirements specified by NACE MR0175 and ISO:15156 certification. According to NACE MR0175 and ISO:15156 certification, it is the manufacturer's responsibility to meet metallurgical requirements and the customer's or user's responsibility to ensure that a material will be satisfactory in the intended environment. When given the application requirements (environment) by the customer or user, Cameron can make technical recommendations in accordance with NACE MR0175 and ISO:15156 certification, but that in no way certifies or warrants the product or materials for the application.

## Standards and specifications

### Design and testing standards

- API Spec 6D
- API Spec 598
- API Spec 607 6th Ed. fire testing
- NACE MR0175 and ISO:15156 certification
- ASME Standard B16.34 (valves, flange end)
- Manufacturers Standardization Society standard practice 6 (MSS SP-6), standard finishes for pipe flanges)
- MSS SP-25 (standard marking system for valves)
- MSS SP-55 (quality standards for steel castings)

### In addition, WKM 370D6 trunnion-mounted ball valves can be supplied to comply with

- Conformité Européenne pressure equipment directive (CE/PED)
- ISO:5211 certification top works
- Canadian registration number (CRN)
- API Spec 608
- Fugitive emissions certification.

10 [250], 12 × 10 [300 × 250]	150	80–285	8,480	5,541	36,792
	300	286–740	13,149	6,237	36,792
	600	741–1,480	23,638	7,295	69,591
	900	1,481–2,220	30,433	8,013	69,591
12 [300]	150	0–285	11,601	6,311	36,792
	300	286–740	21,179	7,430	69,591
	600	741–1,480	31,608	8,405	69,591
	900	1,481–2,220	46,301	10,701	92,606
14 [350]	150	80–285	16,370	10,275	69,591
	300	286–740	26,595	11,555	69,591
	600	741–1,480	45,288	13,634	92,606
16 [400]	150	80–285	21,999	12,447	69,591
	300	286–740	39,436	14,326	92,606
	600	741–1,480	70,917	17,382	173,880

The above values are new valve torque values, where *P* is the maximum operating gauge pressure in psi of the valve.

The above torque values do not contain service factors.

Soaking effects, particle matter, or both in the valve may cause an increase in the torque.

The reset torque is equal to ~80% of the break torque.

For power operation, multiply all of the above values by a minimum factor of 1.25 or customer-specified factor, whichever is larger.

For operating temperatures between –20 to –50 degF [–29 to –46 degC], multiply these values by 1.20.

Actuator selection should be made on customer experience and appropriate service factors.

# Material selection guide

A selection of body, stem, and seat-seal materials for WKM 370D6 ball valves is available. The following list is intended as a guide in the selection of materials for corrosive service. Material suitability is based on ladings at ambient temperatures. Other temperatures may render an inappropriate material-lading combination. No material can be expected to resist all the many ladings found in modern industry. Experience has shown that certain materials can perform satisfactorily within certain limits. The physical properties of a material are affected differently by each corrosive medium. The user must decide which property is of prime importance for his application. Internal moving parts, in contact with the lading, should always carry an "A" rating. Body materials with exposure to corrosive ladings can sometimes carry a "B" rating because metal loss due to corrosion is not as critical. Cameron recommends that tests be run under actual operating conditions to obtain a material's performance ability in any one corrosive medium.
