

Globe Control Valve

GFlo

GFlo

Body sub-assembly

Figure 1: GFlo Body Assembly, Class 150, 300, and 600

Superior performance in liquids and gaseous services is the hallmark of GFlo. Easy, quick and economical maintenance is making GFlo globe control valve more user friendly. The spring cylinder actuated GFlo imparts stiffness and maintains very high precision in positioning, strong response, repeatability and controlled high speed are the characteristics absent in diaphragm operated control valves. GFlo has the thrust capability to shutoff against higher fluid pressures as it can handle up to 150 psg / 10.30 Bar air supply. Valve closure is totally dependent on springs in most diaphragm actuators. The unique design of GFlo enables the spring, fluid pressure and supply air pressure to combine and achieve an extremely tight shutoff. A self aligning seat ring adds to and further improves the shutoff capability.

Galling at cage is the culprit in many common maintenance with globe valves because of the close metal-to-metal contact between plug & cage. The GFlo has two top heavy duty stem guides. Contact between the plug and seat retainer is completely avoided in GFlo. Easy and quick maintenance is permitted due to clamped-in seat and top entry trim. Inventory costs are reduced as most parts needed are interchangeable. Against comparable diaphragm actuators, this actuator is lighter, smaller and very easy to handle.

With MASCOT's Quick-Valve express, Deliveries are immediate in standard GFlo because of its quick manufacturing process.

GFlo are durable, reliable and wear resistant globe valve.

Advantages and Features

Advantages	Features
Obeys the command	Stringent, high-thrust cylinder actuator. Accurate positioning. High repeatability. Ensured Response. Controlled, high-quick stroking action.
No Sticking, no shutting down of process	Cage guiding eliminated. Double stem guiding does not come in contact with operating fluid. Sufficient clearance between plug head and seat retainer.
Pleasure to maintain	Top-entry servicing. Clamped-in seat ring. Evenly and controlled torqued compressed gaskets. Separable flanges. High degree of parts interchangeability. Compact, lightweight design.
No leakage on closure	High-thrust, spring-cylinder actuator. Self-aligning seat ring. Shutoff assisted by fluid pressure, cylinder spring and cylinder pressure. Spring takes valve to desired position, air provide additional force.
Tougher than the Toughest	Anti Corrosion construction. High thrust overcomes high pressures. Anti-cavitation and noise trim options. Heavy-duty plug stem.
Easy installation, Compact body	Compared to diaphragm actuator cylinder actuator is compact in design and has lower center of gravity. Light weight so less pipe stress from static and dynamic loads. Separable end flanges allow the valve to be installed in many orientations and compensate for flange misalignment.
Minimal life-time cost	Excellent interchangeability between sizes and other MASCOT products. Valve design minimizes requirements for stocking spare parts. Stiff, heavy-duty parts provide extended life. Actuator design allows simple, easy maintenance.

Figure 2 : GFlo Control Valve

Figure 3: Globe-style body configuration

Smooth, Streamlined, constant area internal passages with no pockets, permitting high capacity with minimum turbulence is what GFlo-style bodies feature. Manufactured in expensive stainless or alloy steels, they are designed with nearly constant wall thickness, providing lower weight and cost.

Figure 4: Three-way body configuration

For either combining or diverting flow services, three-way bodies are used. Owing to MASCOT's excellent design, high interchangeability; even a standard GFlo valve converts easily to three-way service with the addition of three-way adopter, upper seating, two gaskets, three-way plug and longer bonnet flange studs.

Figure 5: Angle-style body configuration

With all other valve parts remaining the same, the angle-style GFlo is completely interchangeable with two-way globe style except the body and the 1 1/2 inch seat ring.

Figure 6: Steam Jacketed body configuration

GFlo use a standard globe style body for steam jacketed with oversize flange for a full jackets. For partial jacket, standard size flanges are used.

Figure 7:
Separable End and Bonnet Flanges

Figure 8: End Flanges

- (a) ANSI B16.10 Class 600 globe valves
- (b) ANSI/ISA S75.03, 1985
- (c) MASCOT standard
- (d) MASCOT standard to 6-inch, above 6-inches per ANSI B16.10, 1986.

Raised face for either separable or internal flanges comes standard with GFlo body facings. For achieving better sealing spiral grooves are serrated over flange faces. If required other optional facings like, smooth face, ring joint, large and small groove are machined.

Separable End Flanges

On a GFlo, interchangeable separable flanges are standard for valve body up to 4" in class 150, 300 and 600 ANSI rating and for 6" and 8" bodies in class 300 and 600. By simply changing the end flanges which are separable, Class 600 body can be adapted for Class 150, 300 or 600 services. Stainless steel can be specified if the process atmosphere or extreme temperatures command it. Separable flanges are normally furnished in carbon steel for cost saving.

Bonnet Flange

Bonnet flanges have the same separable design as the end flange. Normally carbon steel or stainless steel (if required) can be used as bonnet flange.

Bonnet Flange Bolting

304 and 316 stainless steel studs and bolts are used which are suitable for 423° to 1500° F /-253° to 816° C. temperature. These temperature limits are for maximum pressure allowed by ANSI B16.34, 1988,

Table 1: End Connections

End Connection	Valve Size (inches)	Class	Standard Face -to-Face	Optional Face -to-Face
Separable Flange	1/2 - 4	150 - 600	ANSI (a)	ISA
	6-8	300-600	ISA (b)

	6 - 36	150 - 600	ISA	
	1/2 - 24	900 - 2500	VS(d)	

Figure 9: Body Gaskets

The GFlo is uniquely designed with the bonnet and seat ring gaskets fully protected. Since the bonnet sits metal-to-metal in the body, the bonnet gasket compression is determined by the depth of the gasket step on the bonnet, which is machined to provide the required gasket compression.

When the bonnet is fully installed, force is transmitted through the seat retainer to secure the seat ring in its position. The body, seat retainer and seat ring are all machined to close tolerances to provide the proper gasket compression. Unlike the bonnet, the seat ring does not sit in the body, allowing the small clearance to compensate for manufacturing tolerances and thermal expansion.

Table 3: Gasket Specifications

	Type	Gasket Material	Maximum Gasket Temp. °F / °C	Minimum Gasket Temp. °F / °C
Standard Gaskets	Flat	Teflon (TFE)	350 / 177	-200 / -130
	Spiral Wound	304 S.S./AFG	750 / 400	-20 / -30
	Spiral Wound	316 S.S./AFG	1000 / 538	-20 / -30
Alternate Gaskets	Flat	AFG	600 / 318	-20 / -30
	Flat	KEL-F	350 / 177	-320* / -196*
	Flat	Teflon (FEP)	400 / 204	-320 / -196
	Flat	Grafoil**	1500** / 816**	-320 / -196
	Spiral Wound	316 S.S./Grafoil**	1500** / 816**	-320 / -196
	Hollow O-ring	Inconel X-750	1500 / 816	-20* / -30*

*Lower temperature available upon request.

**Limited to 800 °F / 427°C for oxidizing service.

Figure 10: Yoke Clamp

Yoke Clamps

Usually the actuator is attached to the GFlo body assembly with two precision cast, stainless steel yoke clamps, although in some cases the actuator is bolted directly to the bonnet. Each clamp has an inclined plane surface which, when bolted together, securely fastens the actuator yoke to the bonnet. MASCOT's clamp design allows easy removal under maximum corrosive conditions. Associated bolts and locknuts are provided in plated carbon steel, but if required, stainless steel is also available.

Figure 11: GFlo Bonnet Types

Standard Bonnet

The GFlo body & bonnet are of the same material and can handle temperatures from -20°F to 750°F / -30°C to 400°C . For packing limitations, refer table on page 9.

Extended Bonnet

Prime function of extended bonnet is to protect the packing from excessive heat or cold, aiding the optimal functioning of the valve. It is from carbon steel for temperatures from -20°F to 800°F / -30°C to 427°C and of 304 or 316 stainless steel for -150°F to 1500°F / -100°C to 816°C .

Cold Box Extended Bonnet

The Cold box extended bonnet allows stagnated moderate temperature gas to form in the bonnet, while protecting the packing from the operating fluid. Usually manufactured from 304 or 316 stainless steel, it handles temperatures down to -423°F / -253°C . Standard construction consists of stainless steel bonnet flange and bolting.

Metal Bellows Seal Bonnet

Whenever service fluid leak to the atmosphere needs reduction to an absolute minimum, metal bellows seal comes in handy. The standard metal bellows seal is rated for operation in processes ranging in temperature from -320°F to 1100°F / -196°C to 593°C and pressures to 1100 psig / 75.9 Barg. This flexible metal bellows is usually constructed of Inconel 625, SS 304/316. Metal bellows can also be furnished in Hastelloy C-22.

The bellows design seal allows for outside pressure to minimize bellows squirm, prolonging bellows life.

Metal Bellows Seal Bonnet

Protection is provided by the metal bellows seal against the unwanted packing leakage to atmosphere in processes involving caustic liquids and gases.

The compact, lightweight design makes it ideal for services below 650°F / 343°C and 310 psig / 21.4 Bar G. The precision formed bellows is available in Inconel or Hastelloy C materials.

Since bellows seals are designed for special service conditions and not for valve's design class, it is required to specify the complete service conditions.

Packing & Guides

Being deeper than the conventional boxes, the MASCOT packaging boxes offer the following advantages:

Advantages of MASCOT packing boxes over the conventional types of boxes :

1. Space between the wiper set and the main upper packing avoids contamination of upper packing. The upper set is positioned very far from wiper set to avoid contact with any part of the plug stem which is exposed to the flowing medium. Wiper set wipes clean any fluid on the plug stem.
2. Bonnets are designed to permit wide variety of packing styles, including double set of packing, without changing bonnets.
3. When used with GFlo, large plug stem diameter and two widely-placed stem guides provide exceptional guiding.
4. Lined by Grafoil, the stainless steel provides superior guiding over wide temperature ranges and completely eliminate guide/stem galling. A variety of guides are available for various applications, including solid brass, Stellite and glass-filled Teflon-lined stainless steel.

Figure 12: Typical Teflon V-ring Arrangement

Table 4: Guides

Standard Materials	Max. Temp.	Min. Temp.	Maximum Pressure
Grafoil lined SS***	1500°F / 816° C	-320°F / -196° C	1400 psig/96.6 Barg thru 2-inch 1000 psig/69.0 Barg 3 thru 4-inch 850 psig/58.6 Barg 6-inch & up
Glass-loaded			150 psig/10.3 Barg @100° F/38° C
Teflon-lined S. S.	350° F / 177° C	-423° F / -253° C	100 psig/6.9 Barg @ 350° F/177° C
Solid Bronze	500° F / 260° C	-423° F / -253° C	Same as body
Solid Stellite	1500° F / 816° C	-423° F / -253° C	Same as body

Table 5: Packing

Bonnet Type	Packing Material	Service Fluid Temperature Limitation °F / °C
Standard** Bonnet	Teflon, Teflon/AFP and Glass-filled Teflon	500 / 260 500 / 260
	Graphite/AFP	750 / 400
	Graphite/AFP, Inconel wire	750* / 400*
	Grafoil***	750* / 400*
Extended** Bonnet	Teflon, Teflon/AFP and Glass-filled Teflon	600 / 316
	Graphite/AFP	1200 / 650
	Graphite/AFP, Inconel wire	1200 / 650
	Grafoil***	1500 / 816
Cryogenic Extended Length**		
15, 18-inch	Teflon	-320 / -196
24, 27-inch	Teflon	-423 / -253

* Temperatures assume environmental temperature is less than 90° F / 32° C. 8 thru 12-inch Class 150 thru 600 and 3 thru 12-inch Class 900-2500 handles temperatures to 850° F / 454° C.

** ANSI B16.34 specifies acceptable pressure temperature limits for pressure retaining materials. Consult the factory for additional information.

*** Do not use Grafoil above 800° F / 427° C in oxidizing service such as air or oxygen. The use of Grafoil packing may require oversize actuators or heavier springs due to added friction.

Equal Percentage

Equal percentage characteristic is the most commonly used in process control today.

The change in flow per unit of valve stroke is directly proportional to the flow occurring just before the change is made.

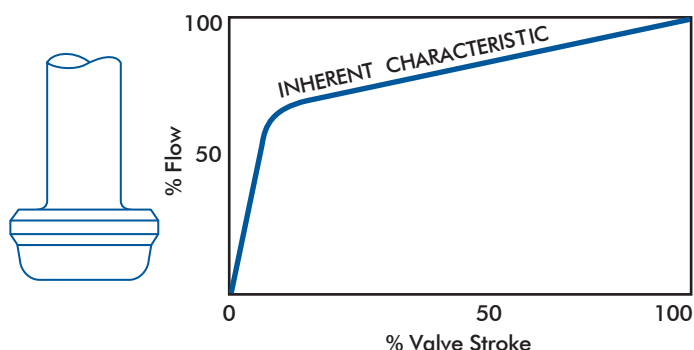

While the flow characteristic of the valve itself may be equal percentage, most control loops will produce an installed characteristic approaching linear when the overall system pressure drop is large relative to that across the valve.

Linear

On those systems where the valve pressure drop is a major portion of the total system pressure drop, linear plugs are used.

Linear inherent characteristic produces equal changes in flow per unit of valve stroke regardless of plug position.

Quick Open

For on-off service, quick open plugs are employed. They are primarily designed to produce maximum flow quickly.

Figure 13: Flow Characteristics

Figure 14: Typical Trim Types

Trim Types

1. Standard full area trim provides maximum CV.
2. Reduced trim is available in a wide variety of sizes when lower CV's and large bodies are required.
3. Integral trim uses a special seat machined into the body and an oversized plug to provide additional CV beyond the capabilities of full area trim.

GFlo's valves can be converted from any trim type to another since all seat rings and plugs with a given size and pressure class are completely interchangeable. Integral trim is available by removing the seat ring and by changing the plug.

Standard & pressure-balanced trim

Figure 15: Standard Trim

The GFlo trim is uniquely designed to avoid the difficulties associated with screwed-in seats and cage-guiding. Removal of the seat is easy even under extremely corrosive conditions because the seat ring is in just clamped into the body by the bonnet and seat retainer.

GFlo plugs are double-stem guided, avoiding contact between the seat retainer and plug, unlike cage-guided trims that easily gall and stick. Because no contact is made with the plug, the retainer can be constructed of stainless steel rather than costly hard materials. The flow characteristic is determined by the plug contour, and not by the opening in the retainer.

Low-noise seat designs have been developed for better noise control in standard GFlo valves.

Metal Seats

Class IV shutoff are handled better with metal seated valves. This class calls for maximum permissible seat leakage of 0.01 percent of rated valve capacity. All MASCOT valves are seat leak tested after assembly and generally are substantially lower in leakage than called by the std. Aligning the seat ring with the plug during assembly gives exceptional seat tightness. Additional seat tightness using metal seats is also available.

Figure 16: Pressure-balanced Trim

In case of very high pressure drops, pressure-balanced trim is used to reduce the thrust necessary to stroke the plug by reducing the trim off-balance area. Because the pressure-balanced plug fits closely to the retainer, this trim should only be used in generally clean services. Flow direction is under the plug for fail-closed and over the plug for fail-open. The seal area less the stem area is designed to be slightly larger than the seat area, thus the plug is off-balanced to close for flow under the seat and off-balanced to open for flow over the seat.

Soft Seats

In applications needing ANSI Class VI "Bubble-tight" shutoff, the GFlo soft seat is used. The design consists of an elastomer sandwiched between two metal pieces. The assembled soft seat is interchangeable with the hard seat for a given size and pressure rating. Inserts are often constructed of Teflon, therefore, maximum temperature should be below 300° F / 150° C at 290 psig / 20 Bar G. For temperatures below -85° F / -65° C, Teflon soft seats can be used in high pressure applications.

Table 6: Standard Seal Temperature Ranges

Teflon Sleeve	-320° F / -196° C @ full rating or +300° F / 150° C @ 150 psig / 10.3 Barg
NiResist Piston Rings	-20° to 800° F / -30° to 427° C
Buna-N O-ring	-60° to 250° F / -51° to 121° C
Rene 41	800° to 1600° F / 427° to 871° C
Spring energized TFE	-365° to 575° F / -221° to 302° C
Viton	-40° to 437° F / -40° to 225° C

Table 6: Material Hardness Ratings

Trim Material	Hardness Rockwell C	Corrosion*Resistance
316 S.S.	8	Excellent
Stellite No. 6	44	Good to Excellent
416 S.S.	40	Fair
440C S.S.	56	Fair
17-4 PH	40	Excellent
Colmonoy	45-50	Fair to Good
Tungsten Carbide	72	Good on Bases Poor on Acids

* General rule only. Check specific application.

Trim Materials & Data

Except in case of special alloy bodies where trims are furnished in the same metal as the body, MASCOT's standard plug and seat ring material is 316 stainless steel. A good range of services are successfully handled by stainless steel trim. Nevertheless, a general rule is to consider hard trim for all choked flow conditions or for temperatures above 600° F / 316° C. MASCOT stocks Stellite no. 6 for many valve trim parts. This material offers a good combination of relative hardness and corrosion resistance. Special alloys, such as Alloy 20, Hastelloy C and Monel, are also available.

For higher/other sizes, please contact factory

Material of construction

Table 13: Packing

Configurations	Standard, Twin seal, Vacuum seal
Materials	Teflon V-ring, Teflon AFP*, AFP/ Inconel wire, Glass-filled Teflon V-ring, Braided Teflon, Grafoil, other materials as required
Lubrication (optional)	Lubricator w/integral isolation valve Lubricator w/additional isolation valve

Table 14: Trim

Characteristics	Equal percentage, Linear, Quick opening
Materials	316 stainless steel Alloy 20 304 stainless steel Nickel 347 stainless steel Titanium 416 stainless steel Monel Hastelloy B 17-4 PH Hastelloy 440 C
Hard Facings	Materials: #6 Stellite, #5 Colmonoy Types: seat surface, full contour, full bore, lower stem guide area
Soft Seat	TFE Teflon, FEP Teflon, KEL-F, Polyurethane, PEEK
Pressure- balanced	Sizes: 2-inch and larger, Seal types: elastomer, metal

Table 15: Guides

Type	Double-top stem, Heavy duty
Materials	Glass-filled Teflon, Grafoil, Stellite, bronze, other materials as required

Table 16: Gaskets

Types	Spiral wound: 304 or 316 stainless steel/non-asbestos filler, Teflon, Grafoil, Flat: Teflon, soft metal Metal O-ring: Inconel X750/silver plated
-------	---

Table 17: Actuators

Types	Double acting cylinder with positive fail-safe spring action, Manual handwheel Electro-hydraulic Electro-mechanical
Sizes	Cylinder: 25, 50, 100 square inch (standard); 200, 300, 400, 500, 600 square inch (optional) Manual Handwheel: 9, 12, 18, 24-inch diameter
Auxiliary	Side-mounted: continuously- connected Top-mounted: continuously-con nected, push-only, limit stops
Materials	Cylinder: anodized aluminum Piston: anodized aluminum Actuator stem: 416 stainless steel Yoke: ductile iron O-rings: Buna N / Viton
Action	Air-to-open, Air-to-close (field reversible)
Max. Working Pressure	150 psig / 10.3 Barg

Table 18: Positioner

Types	Pneumatic, Electro-pneumatic, SMART
Input Signals	Pneumatic: 3-15, 3-9, 9-15, 6-30 psig 0-1, 0-0.6, 0.6-1, 0.4-2.1 Barg and split ranges Electro-pneumatic: 4-20, 10-50 mA
Supply Pressure	40-150 psig / 2.8-10.3 Barg (no supply regulator required)
Standard Materials	Aluminum, stainless steel, Buna N, nickel-plated brass
Adjustments	Stroke range, zero, balance pressure
Action	Air-to-open, Air-to-close (field reversible)

*Asbestos Free Packing (AFP)

Severe Service Trims (Cavitation Control)

Cavitation damage to valve components is effectively minimized by controlling the location of vapor bubble implosion in an area away from metal parts in the Mascot CavFlo trim.

Cavitation Damage - A problem :

Whenever the pressure of flowing liquid through a restricted area of a control valve drops below the vapor pressure of the liquid and recovers to a pressure above the vapor pressure, cavitation damage to control valve and piping components may occur. In the first stage of cavitation, vapor bubbles form downstream of the restricted area at the vena contracta (point of narrowest fluid constraint).

The enlarging passage at downstream of the vena contracta reduces the velocity and thereby associated pressure recovery causes the vapor bubbles collapse or implode suddenly.

This implosion of the bubbles on metal surfaces causes stresses eventually resulting in tearing away particles of the metal from the surface towards inward. Cavitations damages plug and seat of a control valve as throttling occurs at the restriction in the clearance between the plug and seat ring. If the vapor bubbles implode near them, the valve body and piping can also be damaged. Conventionally harder material is used to minimize

Pressure Profile: Single Seat Valve Experiencing Cavitation

The impinging fluid jets form an area of pressure recovery and a fluid cushion. This phenomenon collapses the vapor bubbles in the fluid stream, away from metal parts preventing damages. Stepped holes are used to ensure solid flow and not the hollow tube like flow through the retainer. Thus vena contracta established outside the retainer and not in the retainer. The turbulence of the flow inside the retainer promotes collapsing of the vapor bubbles in the middle of seat retainer, reducing damage to valve trim. CavFlo Trim fits standard GFlo series valve bodies, with pressure-balanced and unbalanced options being available. Because the valve plug slides in the retainer closely, regulating the fluid flow through the holes, the fluid must be free from dirt and pipe muck to avoid seizing of plug with retainer. Size and spacing of holes in the retainer determine flow characteristics and capacity. To achieve desired flow characteristic different sizes of holes with variable spacing can be used on the same size of retainer. CavFlo Trim will always use flow direction of valves as over the plug.

Cavitations Control Trim - A Solution :

Mascot's CavFlo Trim utilizes many small holes for diametrical flow through the walls of the seat retainer. As the valve plug lifts, increased pairs of holes are opened. Each hole discharges a jet of cavitating liquid at the center of retainer, which impinges with a jet of liquid admitted through the opposing hole.

Standard Materials of Construction

Seat Retainer	316 stainless steel or 416 hardened stainless steel
Plug	316 stainless steel with Stellite facing
Seat Ring	316 stainless steel with Stellite facing

NOTE: Refer to Mascot's Globe Valve Body Assembly Bulletin for additional specifications. C C can reduce cavitation damage in low pressure services.

GFlo

Severe Service Trims (Noise Reduction)

MagaFlo trim overcome the problem of control valve noise by dealing effectively with gaseous pressure reduction, and by controlling turbulence carried into the downstream piping.

Pressure Profile Single Seat

The Basic Principles In conventional single-throttling-point globe control valves, a vena contracta (point of greatest flow constriction) occurs immediately at the downstream of throttling point. A simplified pressure profile of the fluid as it passes through the valve shows slight pressure loss in the inlet and outlet passages, and a substantial reduction of pressure at the vena contracta. Note that the overall pressure drop between the inlet and the outlet does not reveal how far the pressure may have dropped within the valve itself.

The Problem with Gases The problem becomes apparent by superimposing a velocity profile on the pressure profile, discussed above. For single-throttling-point control valves, with the sharp pressure reduction, the velocity will be greatly increased at the vena contracta. While considerable noise can be generated as velocities in the valve approach sonic levels, substantial noise can be generated even where inlet and outlet velocities are significantly less than sonic.

The Solution Without allowing a sharp pressure drop at the vena contracta reduce the pressure from inlet to outlet gradually. Thus, gaseous velocities are maintained at remarkable values throughout the valve and high noise levels are simply not generated. Also, by breaking the flow into many small flow streams, turbulent energy is reduced and dissipated. In addition, noise generated upstream is substantially blocked by successive stages.

Gaseous Noise

The Solution

Down stream noise reduction (dB) plates are also available
